

AC '97 Six Channel CNR Audio Reference Design with PLL

Features

- Phase Locked Loop (PLL) Codec Operation
- Six Channel Analog Audio Outputs
- Headphone Sense using GPIO
- CS4202 codec and two CS4334 DACs
- 20-bit D to A conversion (DAC)
- 18-bit A to D conversion (ADC)
- S/PDIF (IEC-958) optical digital output
- Complete suite of Analog I/O connections:
 - Line, Mic, CD, Video, Modem, and Aux Inputs
 - Modem, Headphone, Line Front, Line Rear and Line Center/Sub-Woofer Outputs
- 2-layer low cost PC board
- Complies with Intel® AC '97 revision 2.2
- Exceeds Microsoft's® PC 2001 audio performance requirements.

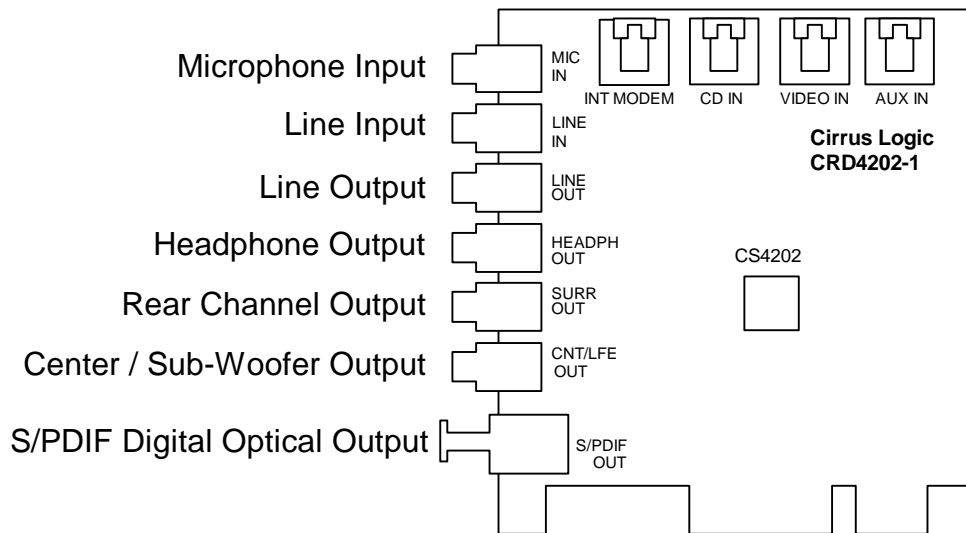

Description

The CRD4202-2 reference design eliminates the cost of the 24.567 MHz crystal by operating the CS4202 in Phase Locked Loop (PLL) mode. This reference design also features six channel analog audio outputs, an optical S/PDIF digital output, and Communication and Networking Riser (CNR) interface. This design uses the CS4202 audio codec which has several advanced features including a built-in headphone amplifier, simultaneous six channel analog and S/PDIF optical digital output, GPIO for headphone detection, and up to 30 dB of internal microphone boost.

The CRD4202-2 reference design is available by ordering the *CMK4202-2* manufacturing kit. This kit includes the CRD4202-2 board, a full set of schematic design files (OrCAD® format), PCB job files (PADS® ASCII), PCB artwork files, and bill of materials. This reference design offers significant cost savings over competing solutions and can be easily modified to meet your specific design goals.

1. GENERAL INFORMATION

The CRD4202-2 CNR reference design features six channel CD quality analog and S/PDIF digital audio outputs. The card includes the CS4202 AC '97 audio codec operating in PLL mode, and two CS4334 24-bit serial stereo DACs. This combination gives the CRD4202-2 a rich feature set and industry leading audio performance.

The CS4202 audio codec includes a stereo 20-bit DAC, a stereo 18-bit ADC, and a very flexible analog audio mixer. The serial data outputs are paired with two CS4334 DACs to provide four additional channels of analog audio. The CS4202 also features three stereo pairs of line level analog inputs, a microphone input, and a stereo pseudo-differential CD input. The input signals can be routed to the ADC for recording or mixed together for recording and direct playback. The CS4202 has internal registers that are used to control its various features such as volume levels, audio muting, and signal routing. The CS4202 maintains high audio quality and exceeds the Microsoft® PC 2001 audio performance specifications.

The CS4202 audio codec communicates to the audio controller across the CNR interface using the AC-Link. The AC-Link is a 5-wire serial digital interface that transfers digital audio data and GPIO control/status data between the two devices, sends commands from the audio controller to the codec, and provides codec status information to the controller. For additional information on the AC-Link, see the Intel® AC '97 revision 2.2 specification.

2. SCHEMATIC DESCRIPTION

The block diagram in Figure 1 illustrates the interconnections between the schematic pages found at the end of this document. Sections 2.1 through 2.8 describe the circuitry contained in these schematics.

2.1 CS4202 Audio Codec

The CS4202 audio codec is shown in Figure 2. The analog input signals to the CS4202 originate from the inputs in Figure 3, while the analog outputs are shown in Figure 4 and Figure 5. AFLT1 and AFLT2 (pins 29, 30) require 1000 pF NPO/C0G capacitors connected to analog ground. These capacitors provide a single pole lowpass filter to the inputs of the CS4202 ADC. No other input filtering is required.

The AC-Link may require series termination resistors to prevent reflections. These are normally placed as close as possible to the transmitting end of the AC-Link signal. The CS4202 SDATA_IN (pin 8) and BIT_CLK (pin 6) outputs have 47 Ω series termination resistors.

The CS4202 is powered by separate analog and digital power supplies, each with their own respective grounds. The AGND symbols refer to analog ground and DGND symbols refer to digital ground. For best results, connect the grounds together at a single point with a 0.050 inch trace underneath the CS4202. Each power pin requires an individual decoupling capacitor. These decoupling capacitors are placed as close as possible to their respective pins. The CS4202 audio codec uses a 0.1 μ F ceramic capacitor for each of the +3.3 V digital and +5 V analog supply pins.

2.2 Analog Inputs

The LINE_IN, VIDEO_IN, and AUX_IN stereo inputs shown in Figure 3 are AC-coupled to the CS4202 codec with 1 μ F capacitors to minimize low frequency roll-off. The pull down resistors are recommended to prevent noise from coupling to the analog inputs when they are not in use. Locations for 6 dB dividers were provided for 2.0 Vrms input compatibility, but are not required for PC 2001 compliance.

The microphone input is AC-coupled with a 1 μ F capacitor to minimize low frequency roll-off. The

microphone circuit provides low voltage phantom power for electret microphones. Phantom power is derived from the +5 V analog supply and provides a maximum of 4.2 V under no load and a minimum of 2.0 V under a 0.8 mA load, as required by PC 2001 specifications.

The CS4202 features a pseudo-differential CD input that minimizes common mode noise and interference. Each CD signal acts as one side of the differential input and CD_C acts as the other side. CD_C is used as the common return path for both the left and right channels.

2.3 Center, LFE, and Surround Outputs

The audio outputs in Figure 4 drive the rear speakers (surround), center speaker (CNT), and sub-woofer (LFE) in six channel applications. These four outputs are driven digitally from the CS4202 through two serial output ports and converted to analog audio through two high-performance CS4334 24-bit stereo DACs.

2.4 Front Channel and Headphone Outputs

Figure 5 details the Headphone and Line Output circuits. The Line Outputs are the main analog outputs in a two channel system, and become the Front Outputs in a six channel audio system.

The CS4202 has a built in headphone amplifier on pins 39 and 41. These outputs are capable of driving headphones with impedances as low as 32 Ω . The headphone outputs are AC-coupled through 220 μ F capacitors. These large capacitor values create excellent low frequency response even under 32 Ω loads.

2.5 S/PDIF Optical Output

The S/PDIF (IEC-958) digital output shown in Figure 6 is compatible with digital inputs on consumer devices such as Mini Disk recorders and consumer stereo receivers. The S/PDIF output operates at a fixed sampling frequency of 48 kHz. It

uses an industry standard Toshiba TOTX-173 optical TOSLINK transmitter.

2.6 CNR Connector and EEPROM

The CNR connector is shown in Figure 7. CNR is a motherboard interface that supports audio, modem, and LAN subsystems. CNR applications are targeted at OEMs, system manufacturers, and system integrators who wish take advantage of physically separating their audio, modem, or LAN circuitry from the PC motherboard. CNR accomplishes this without the additional cost associated with the interface circuitry required for a PCI bus add-in card.

The CRD4202-2 uses the AC-Link, SMBus, and power supply pins. The SMBus signals are connected to an AT24C02 EEPROM to provide Plug-and-Play functionality for the CNR card. The EEPROM holds the Subsystem Vendor ID and Subsystem ID. It also contains other information for implementing a Plug-and-Play CNR card. For additional information on the CNR design specifications, programming utilities, and information on programming the EEPROM, visit the Intel® Communications and Network Riser (CNR) homepage at <http://developer.intel.com/technology/cnr/>.

2.7 Auto Demotion Circuit

The configuration of the codec on the CRD4202-2 will always be set as the primary audio codec in PLL mode. In crystal mode operation it can automatically demote to a secondary codec in the presence of a motherboard codec when R54 is changed to 100 k Ω (Figure 9). This feature is in accordance with the *AC '97 Codec Disable and Demotion Rules*.

2.8 Phase Locked Loop

The CRD4202-2 reference design is configured to operate the CS4202 in Phase Locked Loop (PLL) mode as the primary codec. The external clock must be one of the three supported rates, and the codec ID pins must be properly configured to identify

the input clock frequency. Location Y2 in Figure 8 is populated with a 14.31818 MHz surface mounted clock oscillator (test clock) to demonstrate the CS4202 PLL operation.

2.9 Component Selection

Great attention was given to the particular components used on the CRD4202-2 board with cost, performance, and package selection as the most important factors. Listed are some of the guidelines used in the selection of components:

- No components smaller than 0805 SMT package.
- Only single package passive components. No resistor packs. This reduces the risk of crosstalk between analog audio signals.
- All components except connectors are in surface mount packages.

2.10 EMI Components

Optional capacitors or inductors may be included to help the board meet EMI compliance tests, such as FCC Part 15. Choose these component values according to individual requirements.

3. GROUNDING AND LAYOUT

The component layout and signal routing of the CRD4202-2 provide a good model for developing new CNR add-in card designs.

3.1 Partitioned Voltage and Ground Planes

It is critical for good audio performance to separate digital and analog sections to prevent digital noise from affecting the performance of the analog circuits. The analog section of the CRD4202-2 is physically isolated from the digital section with a 0.10 inch partition. Partitioning is defined as the absence of copper on all PCB signal layers. The analog and digital sections have their own separate ground planes. All analog components, power traces, and signal traces are routed over the analog

ground plane. Digital components, power traces, and signal traces are not allowed to crossover into the analog section.

The CS4202 audio codec is placed at the transition point between the analog and digital ground planes. *The analog and digital ground planes must be tied together externally for the CS4202 to maintain proper voltage references.* For best results, the two ground planes are tied together with a single 0.050 inch trace under the CS4202 near its digital ground pins.

Data converters are generally susceptible to noise on the crystal pins. In order to reduce noise from coupling onto these pins, the area around the 24.576 MHz crystal and its signal traces are filled with copper on the top and bottom of the PCB and attached to digital ground.

A separate chassis ground provides a noise-free reference point for all of the EMI suppression components. The chassis ground plane is connected to the analog ground plane at the external jacks.

3.2 AC-Link

According to the AC '97 revision 2.2 specification, the AC-Link signals can have a maximum capacitance (including traces, connectors, and circuitry) of 47.5 pF on BIT CLK and SDATA_IN (assuming a single codec). If this capacitance is exceeded, timing violations may occur and cause the system to malfunction. In order to avoid adding excessive capacitance, do not add any EMI capacitors to ground on any of the AC-Link lines. In addition, keep the trace length of the AC-Link as short as possible. *Keeping the AC-Link trace length under 8 inches is strongly recommend.*

3.3 CS4202 Layout Notes

Refer to the *CS4202 Data Sheet* for analog and digital partitioning guidelines and bypass capacitor placement. Pay special attention to the location of bypass capacitors on REFFLT, AFLT1, AFLT2, and the placement of the power supply capacitors.

 Connect CGND to DGND with a 50 mil trace near the finger edge of the board.

Figure 7. CNR Connector

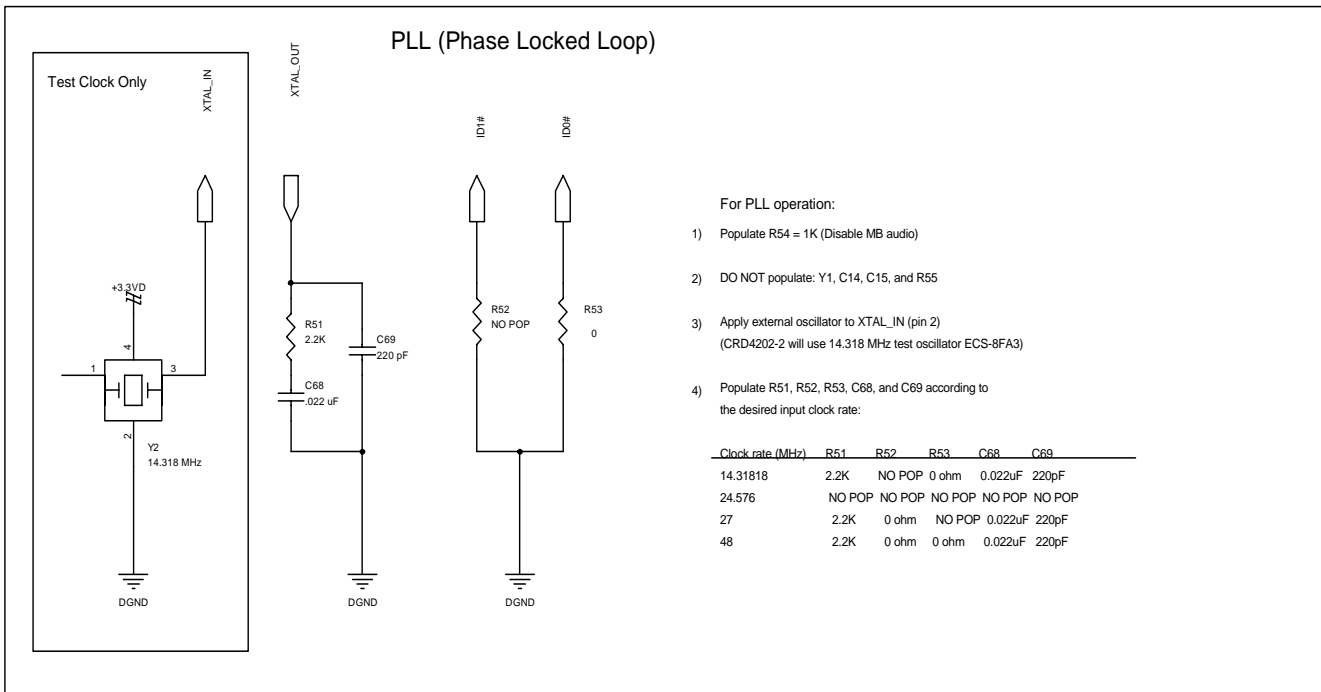

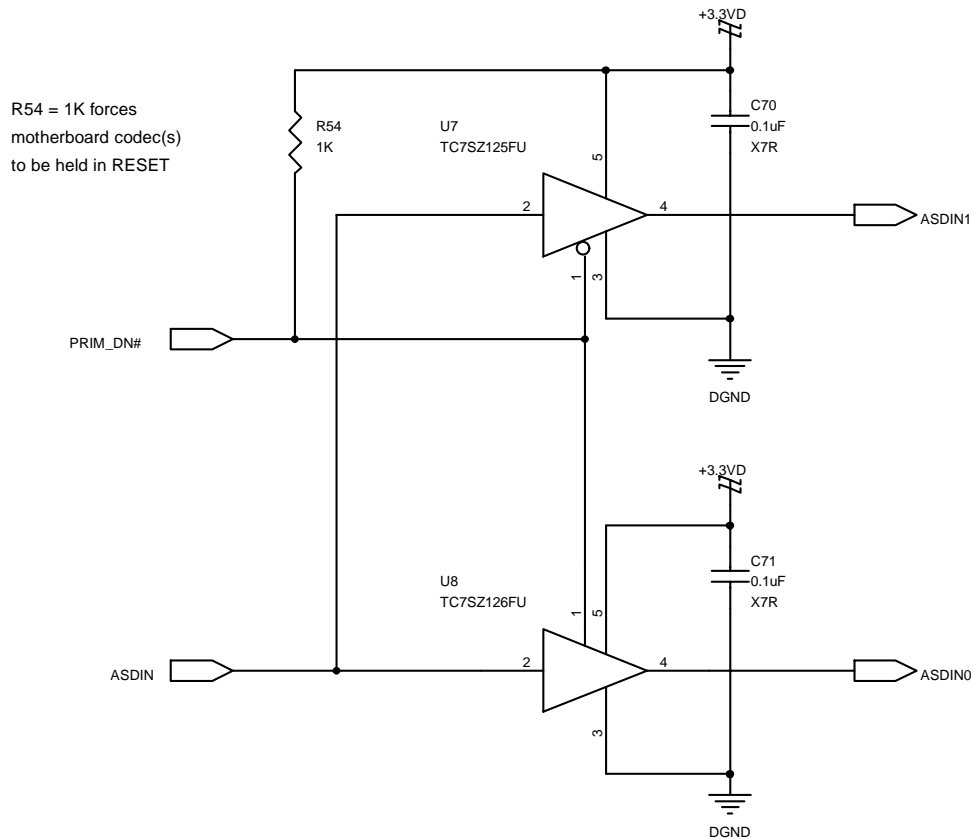

Figure 8. Phase Locked Loop

DO NOT use this circuit for motherboard designs. This circuit is strictly for CNR cards.

For motherboard designs:
 connect ASDIN to ASDIN0 if primary codec,
 connect ASDIN to ASDIN1 if secondary codec.

Replace R54 with 100K for automatic demotion
 when used with primary motherboard codec(s).
