## 8-Bit Micro Power Digital-to-Analog Converter with Rail-to-Rail Output

### General Description

The DAC081S101 is a full-featured, general purpose 8-bit voltage-output digital-to-analog converter (DAC) that can operate from a single +2.7V to 5.5V supply and consumes just 175  $\mu$ A of current at 3.6 Volts. The on-chip output amplifier allows rail-to-rail output swing and the three wire serial interface operates at clock rates up to 30 MHz over the specified supply voltage range and is compatible with standard SPI™, QSPI, MICROWIRE and DSP interfaces. Competitive devices are limited to 20 MHz clock rates at supply voltages in the 2.7V to 3.6V range.

The supply voltage for the DAC081S101 serves as its voltage reference, providing the widest possible output dynamic range. A power-on reset circuit ensures that the DAC output powers up to zero volts and remains there until there is a valid write to the device. A power-down feature reduces power consumption to less than a microWatt.

The low power consumption and small packages of the DAC081S101 make it an excellent choice for use in battery operated equipment.

The DAC081S101 is a direct replacement for the AD5300 and is one of a family of pin compatible DACs, including the 10-bit DAC101S101 and the 12-bit DAC121S101. The DAC081S101 operates over the extended industrial temperature range of  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ .

### Features

- Guaranteed Monotonicity
- Low Power Operation
- Rail-to-Rail Voltage Output
- Power-on Reset to Zero Volts Output
- SYNC Interrupt Facility
- Wide power supply range (+2.7V to +5.5V)
- Small Packages
- Power Down Feature

### Key Specifications

- Resolution 8 bits
- DNL  $+0.04, -0.02$  LSB (typ)
- Output Settling Time 3  $\mu$ s (typ)
- Zero Code Error 3.8 mV (typ)
- Full-Scale Error  $-0.07$  %FS (typ)
- Power Consumption
  - Normal Mode 0.63 mW (3.6V) / 1.41 mW (5.5V) typ
  - Pwr Down 0.14  $\mu$ W (3.6V) / 0.33  $\mu$ W (5.5V) typ Mode

### Applications

- Battery-Powered Instruments
- Digital Gain and Offset Adjustment
- Programmable Voltage & Current Sources
- Programmable Attenuators

### Pin Configuration

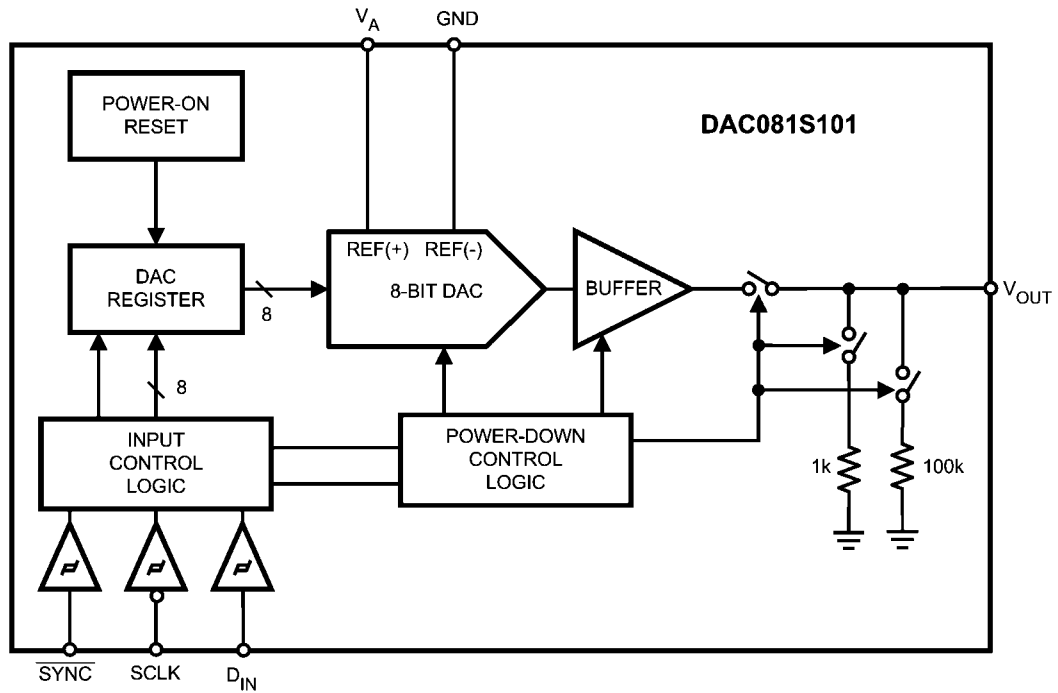

### Ordering Information

Order Numbers	Temperature Range	Package	Top Mark
DAC081S101CIMM	$-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$	MSOP	X64C
DAC081S101CIMMX	$-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$	MSOP Tape-and-Reel	X64C
DAC081S101CIMK	$-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$	TSOT	X65C

## Pin Descriptions

TSOT (SOT-23) Pin No.	MSOP Pin No.	Symbol	Description
1	4	V <sub>OUT</sub>	DAC Analog Output Voltage.
2	8	GND	Ground reference for all on-chip circuitry.
3	1	V <sub>A</sub>	Power supply and Reference input. Should be decoupled to GND.
4	7	D <sub>IN</sub>	Serial Data Input. Data is clocked into the 16-bit shift register on the falling edges of SCLK after the fall of SYNC.
5	6	SCLK	Serial Clock Input. Data is clocked into the input shift register on the falling edges of this pin.
6	5	SYNC	Frame synchronization input for the data input. When this pin goes low, it enables the input shift register and data is transferred on the falling edges of SCLK. The DAC is updated on the 16th clock cycle unless SYNC is brought high before the 16th clock, in which case the rising edge of SYNC acts as an interrupt and the write sequence is ignored by the DAC.
	2, 3	NC	No Connect. There is no internal connection to these pins.

## Absolute Maximum Ratings

(Notes 1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage, $V_A$	6.5V
Voltage on any Input Pin	-0.3V to ( $V_A + 0.3V$ )
Input Current at Any Pin (Note 3)	10 mA
Package Input Current (Note 3)	20 mA
Power Consumption at $T_A = 25^\circ\text{C}$	See (Note 4)
ESD Susceptibility (Note 5)	
Human Body Model	2500V
Machine Model	250V

Soldering Temperature, Infrared, 10 Seconds (Note 6)	235°C
Storage Temperature	-65°C to +150°C

## Operating Ratings (Notes 1, 2)

Operating Temperature Range	$-40^\circ\text{C} \leq T_A \leq +105^\circ\text{C}$
Supply Voltage, $V_A$	+2.7V to 5.5V
Any Input Voltage (Note 7)	-0.1 V to ( $V_A + 0.1$ V)
Output Load	0 to 1500 pF
SCLK Frequency	Up to 30 MHz

## Package Thermal Resistances

Package	$\theta_{JA}$
8-Lead MSOP	240°C/W
6-Lead TSOT	250°C/W

## Electrical Characteristics

Values shown in this table are design targets and are subject to change before product release.

The following specifications apply for  $V_A = +2.7V$  to  $+5.5V$ ,  $R_L = 2k\Omega$  to GND,  $C_L = 200$  pF to GND,  $f_{SCLK} = 30$  MHz, input code range 4 to 251. **Boldface limits apply for  $T_{MIN} \leq T_A \leq T_{MAX}$** ; all other limits  $T_A = 25^\circ\text{C}$ , unless otherwise specified.

## A.C. and Timing Characteristics

Values shown in this table are design targets and are subject to change before product release.

The following specifications apply for  $V_A = +2.7V$  to  $+5.5V$ ,  $R_L = 2k\Omega$  to GND,  $C_L = 200$  pF to GND,  $f_{SCLK} = 30$  MHz, input code range 4 to 251. **Boldface limits apply for  $T_{MIN} \leq T_A \leq T_{MAX}$** ; all other limits  $T_A = 25^\circ C$ , unless otherwise specified.

Symbol	Parameter	Conductions		Typical	Limits	Units (Limits)
$f_{SCLK}$	SCLK Frequency				<b>30</b>	MHz (max)
$t_s$	Output Voltage Settling Time (Note 10)	40h to C0h code change, $R_L = 2k\Omega$	$C_L \leq 200$ pF	3	<b>5</b>	$\mu s$ (max)
SR	Output Slew Rate			1		V/ $\mu s$
	Glitch Impulse	Code change from 80h to 7Fh		12		nV-sec
	Digital Feedthrough			0.5		nV-sec
$t_{WU}$	Wake-Up Time	$V_A = 5V$		6		$\mu s$
		$V_A = 3V$		39		$\mu s$
$1/f_{SCLK}$	SCLK Cycle Time				<b>33</b>	ns (min)
$t_H$	SCLK High time			5	<b>13</b>	ns (min)
$t_L$	SCLK Low Time			5	<b>13</b>	ns (min)
$t_{SUCL}$	Set-up Time $\overline{SYNC}$ to SCLK Rising Edge			-15	<b>0</b>	ns (min)
$t_{SUD}$	Data Set-Up Time			2.5	<b>5</b>	ns (min)
$t_{DHD}$	Data Hold Time			2.5	<b>4.5</b>	ns (min)
$t_{CS}$	SCLK fall to rise of $\overline{SYNC}$	$V_A = 5V$		0	<b>3</b>	ns (min)
		$V_A = 3V$		-2	<b>1</b>	ns (min)
$t_{SYNC}$	$\overline{SYNC}$ High Time	$2.7 \leq V_A \leq 3.6$		9	<b>20</b>	ns (min)
		$3.6 \leq V_A \leq 5.5$		5	<b>10</b>	ns (min)

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

**Note 2:** All voltages are measured with respect to GND = 0V, unless otherwise specified

**Note 3:** When the input voltage at any pin exceeds the power supplies (that is, less than GND, or greater than  $V_A$ ), the current at that pin should be limited to 10 mA. The 20 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 10 mA to two.

**Note 4:** The absolute maximum junction temperature ( $T_{j,max}$ ) for this device is  $150^\circ C$ . The maximum allowable power dissipation is dictated by  $T_{j,max}$ , the junction-to-ambient thermal resistance ( $\theta_{JA}$ ), and the ambient temperature ( $T_A$ ), and can be calculated using the formula  $P_{D,MAX} = (T_{j,max} - T_A) / \theta_{JA}$ . The values for maximum power dissipation will be reached only when the device is operated in a severe fault condition (e.g., when input or output pins are driven beyond the power supply voltages, or the power supply polarity is reversed). Obviously, such conditions should always be avoided.

**Note 5:** Human body model is 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor. Machine model is 220 pF discharged through ZERO Ohms.

**Note 6:** See the section entitled "Surface Mount" found in any post 1986 National Semiconductor Linear Data Book for methods of soldering surface mount devices.

**Note 7:** The analog inputs are protected as shown below. Input voltage magnitudes up to  $V_A + 300$  mV or to 300 mV below GND will not damage this device. However, errors in the conversion result can occur if any input goes above  $V_A$  or below GND by more than 100 mV. For example, if  $V_A$  is  $2.7V_{DC}$ , ensure that  $-100mV \leq$  input voltages  $\leq 2.8V_{DC}$  to ensure accurate conversions.

20155104

**Note 8:** To guarantee accuracy, it is required that  $V_A$  be well bypassed.

**Note 9:** Typical figures are at  $T_j = 25^\circ C$ , and represent most likely parametric norms. Test limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

**Note 10:** This parameter is guaranteed by design and/or characterization and is not tested in production.

## Specification Definitions

**DIFFERENTIAL NON-LINEARITY (DNL)** is the measure of the maximum deviation from the ideal step size of 1 LSB, which is  $V_{REF} / 256 = V_A / 256$ .

**DIGITAL FEEDTHROUGH** is a measure of the energy injected into the analog output of the DAC from the digital inputs when the DAC outputs are not updated. It is measured with a full-scale code change on the data bus.

**FULL-SCALE ERROR** is the difference between the actual output voltage with a full scale code (FFh) loaded into the DAC and the value of  $V_A \times 255 / 256$ .

**GAIN ERROR** is the deviation from the ideal slope of the transfer function. It can be calculated from Zero and Full-Scale Errors as  $GE = FSE - ZE$ , where GE is Gain error, FSE is Full-Scale Error and ZE is Zero Error.

**GLITCH IMPULSE** is the energy injected into the analog output when the input code to the DAC register changes. It is specified as the area of the glitch in nanovolt-seconds.

**INTEGRAL NON-LINEARITY (INL)** is a measure of the deviation of each individual code from a straight line through the input to output transfer function. The deviation of any given code from this straight line is measured from the center of that code value. The end point method is used. INL for this product is specified over a limited range, per the Electrical Tables.

**LEAST SIGNIFICANT BIT (LSB)** is the bit that has the smallest value or weight of all bits in a word. This value is

$$LSB = V_{REF} / 2^n$$

where  $V_{REF}$  is the supply voltage for this product, and "n" is the DAC resolution in bits, which is 8 for the DAC081S101.

**MAXIMUM LOAD CAPACITANCE** is the maximum capacitance that can be driven by the DAC with output stability maintained.

**MONOTONICITY** is the condition of being monotonic, where the DAC has an output that never decreases when the output code increases.

**MOST SIGNIFICANT BIT (MSB)** is the bit that has the largest value or weight of all bits in a word. Its value is 1/2 of  $V_A$ .

**POWER EFFICIENCY** is the ratio of the output current to the total supply current. The output current comes from the power supply. The difference between the supply and output currents, is the power consumed by the device without a load.

**SETTLING TIME** is the time for the output to settle within 1/2 LSB of the final value after the input code is updated.

**WAKE-UP TIME** is the time for the output to settle to within 1/2 LSB of the final value after the device is commanded to the active mode from any of the power down modes.

**ZERO CODE ERROR** is the output error, or voltage, present at the DAC output after a code of 00h has been entered.

# 1.0 Functional Description

## 1.1 DAC SECTION

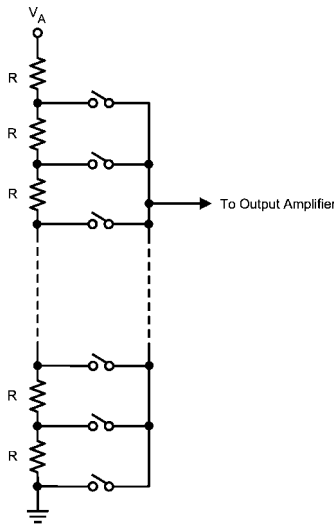

The DAC081S101 is fabricated on a CMOS process with an architecture that consists of switches and a resistor string that are followed by an output buffer. The power supply serves as the reference voltage. The input coding is straight binary with an ideal output voltage of:

$$V_{OUT} = V_A \times (D / 256)$$

where *D* is the decimal equivalent of the binary code that is loaded into the DAC register and can take on any value between 0 and 255.

## 1.2 RESISTOR STRING

The resistor string is shown in *Figure 3*. This string consists of 4096 equal valued resistors with a switch at each junction of two resistors, plus a switch to ground. The code loaded into the DAC register determines which switch is closed, connecting the proper node to the amplifier. This configuration guarantees that the DAC is monotonic.

20155107

FIGURE 3. DAC Resistor String

## 1.3 OUTPUT AMPLIFIER

The output buffer amplifier is a rail-to-rail type, providing an output voltage range of 0V to *V<sub>A</sub>*. All amplifiers, even rail-to-rail types, exhibit a loss of linearity as the output approaches the supply rails (0V and *V<sub>A</sub>*, in this case). For this reason, linearity is specified over less than the full output range of the DAC. The output capabilities of the amplifier are described in the Electrical Tables.

## 1.4 SERIAL INTERFACE

The three-wire interface is compatible with SPI, QSPI and MICROWIRE as well as most DSPs. See the Timing Diagram for information on a write sequence.

A write sequence begins by bringing the *SYNC* line low. Once *SYNC* is low, the data on the *D<sub>IN</sub>* line is clocked into the 16-bit serial input register on the falling edges of *SCLK*. On the 16th falling clock edge, the last data bit is clocked in and the programmed function (a change in the mode of operation and/or a change in the DAC register contents) is executed. At this point the *SYNC* line may be kept low or brought high. In either case, it must be brought high for the minimum specified time

before the next write sequence as a falling edge of *SYNC* is used to initiate the next write cycle.

Since the *SYNC* and *D<sub>IN</sub>* buffers draw more current when they are high, they should be idled low between write sequences to minimize power consumption.

## 1.5 INPUT SHIFT REGISTER

The input shift register, *Figure 4*, has sixteen bits. The first two bits are "don't cares" and are followed by two bits that determine the mode of operation (normal mode or one of three power-down modes). The contents of the serial input register are transferred to the DAC register on the sixteenth falling edge of *SCLK*. See Timing Diagram, *Figure 2*.

20155108

FIGURE 4. Input Register Contents

Normally, the *SYNC* line is kept low for at least 16 falling edges of *SCLK* and the DAC is updated on the 16th *SCLK* falling edge. However, if *SYNC* is brought high before the 16th falling edge, the shift register is reset and the write sequence is invalid. The DAC register is not updated and there is no change in the mode of operation or in the output voltage.

## 1.6 POWER-ON RESET

The power-on reset circuit controls the output voltage during power-up. Upon application of power the DAC register is filled with zeros and the output voltage is 0 Volts and remains there until a valid write sequence is made to the DAC.

## 1.7 POWER-DOWN MODES

The DAC081S101 has four modes of operation. These modes are set with two bits (DB13 and DB12) in the control register.

TABLE 1. Modes of Operation

DB13	DB12	Operating Mode
0	0	Normal Operation
0	1	Power-Down with 1kΩ to GND
1	0	Power-Down with 100kΩ to GND
1	1	Power-Down with Hi-Z

When both DB13 and DB12 are 0, the device operates normally. For the other three possible combinations of these bits the supply current drops to its power-down level and the output is pulled down with either a 1kΩ or a 100kΩ resistor, or is in a high impedance state, as described in *Table 1*.

The bias generator, output amplifier, the resistor string and other linear circuitry are all shut down in any of the power-down modes. However, the contents of the DAC register are unaffected when in power-down, so when coming out of power down the output voltage returns to the same voltage it was before entering power down. Minimum power consumption is achieved in the power-down mode with *SCLK* disabled and *SYNC* and *D<sub>IN</sub>* idled low. The time to exit power-down (Wake-Up Time) is typically *t<sub>WU</sub>* μsec as stated in the A.C. and Timing Characteristics Table.

## 2.0 Applications Information

The simplicity of the DAC081S101 implies ease of use. However, it is important to recognize that any data converter that utilizes its supply voltage as its reference voltage will have essentially zero PSRR (Power Supply Rejection Ratio). Therefore, it is necessary to provide a noise-free supply voltage to the device.

### 2.1 DSP/MICROPROCESSOR INTERFACING

Interfacing the DAC081S101 to microprocessors and DSPs is quite simple. The following guidelines are offered to hasten the design process.

#### 2.1.1 ADSP-2101/ADSP2103 Interfacing

Figure 5 shows a serial interface between the DAC081S101 and the ADSP-2101/ADSP2103. The DSP should be set to operate in the SPORT Transmit Alternate Framing Mode. It is programmed through the SPORT control register and should be configured for Internal Clock Operation, Active Low Framing and 16-bit Word Length. Transmission is started by writing a word to the Tx register after the SPORT mode has been enabled.

FIGURE 5. ADSP-2101/2103 Interface

#### 2.1.2 80C51/80L51 Interface

A serial interface between the DAC081S101 and the 80C51/80L51 microcontroller is shown in Figure 6. The SYNC signal comes from a bit-programmable pin on the microcontroller. The example shown here uses port line P3.3. This line is taken low when data is to be transmitted to the DAC081S101. Since the 80C51/80L51 transmits 8-bit bytes, only eight falling clock edges occur in the transmit cycle. To load data into the DAC, the P3.3 line must be left low after the first eight bits are transmitted. A second write cycle is initiated to transmit the second byte of data, after which port line P3.3 is brought high. The 80C51/80L51 transmit routine must recognize that the 80C51/80L51 transmits data with the LSB first while the DAC081S101 requires data with the MSB first.

FIGURE 6. 80C51/80L51 Interface

#### 2.1.3 68HC11 Interface

A serial interface between the DAC081S101 and the 68HC11 microcontroller is shown in Figure 7. The SYNC line of the DAC081S101 is driven from a port line (PC7 in the figure), similar to the 80C51/80L51.

The 68HC11 should be configured with its CPOL bit as a zero and its CPHA bit as a one. This configuration causes data on

the MOSI output to be valid on the falling edge of SCLK. PC7 is taken low to transmit data to the DAC. The 68HC11 transmits data in 8-bit bytes with eight falling clock edges. Data is transmitted with the MSB first. PC7 must remain low after the first eight bits are transferred. A second write cycle is initiated to transmit the second byte of data to the DAC, after which PC7 should be raised to end the write sequence.

FIGURE 7. 68HC11 Interface

#### 2.1.4 Microwire Interface

Figure 8 shows an interface between a Microwire compatible device and the DAC081S101. Data is clocked out on the rising edges of the SCLK signal.

FIGURE 8. Microwire Interface

## 2.2 USING REFERENCES AS POWER SUPPLIES

Recall the need for a quiet supply source for devices that use their power supply voltage as a reference voltage.

Since the DAC081S101 consumes very little power, a reference source may be used as the supply voltage. The advantages of using a reference source over a voltage regulator are accuracy and stability. Some low noise regulators can also be used for the power supply of the DAC081S101. Listed below are a few power supply options for the DAC081S101.

### 2.2.1 LM4130

The LM4130 reference, with its 0.05% accuracy over temperature, is a good choice as a power source for the DAC081S101. Its primary disadvantage is the lack of 3V and 5V versions. However, the 4.096V version is useful if a 0 to 4.095V output range is desirable or acceptable. Bypassing the LM4130 VIN pin with a 0.1µF capacitor and the VOUT pin with a 2.2µF capacitor will improve stability and reduce output noise. The LM4130 comes in a space-saving 5-pin SOT23.

FIGURE 9. The LM4130 as a power supply

### 2.2.2 LM4050

Available with accuracy of 0.44%, the LM4050 shunt reference is also a good choice as a power regulator for the DAC081S101. It does not come in a 3 Volt version, but 4.096V and 5V versions are available. It comes in a space-saving 3-pin SOT23.

20155114

**FIGURE 10. The LM4050 as a power supply**

The minimum resistor value in the circuit of *Figure 10* should be chosen such that the maximum current through the LM4050 does not exceed its 15 mA rating. The conditions for maximum current include the input voltage at its maximum, the LM4050 voltage at its minimum, the resistor value at its minimum due to tolerance, and the DAC081S101 draws zero current. The maximum resistor value must allow the LM4050 to draw more than its minimum current for regulation plus the maximum DAC081S101 current in full operation. The conditions for minimum current include the input voltage at its minimum, the LM4050 voltage at its maximum, the resistor value at its maximum due to tolerance, and the DAC081S101 draws its maximum current. These conditions can be summarized as

$$R(\min) = (V_{IN}(\max) - V_Z(\min)) / (I_A(\min) + I_Z(\max))$$

and

$$R(\max) = (V_{IN}(\min) - V_Z(\max)) / (I_A(\max) + I_Z(\min))$$

where  $V_Z(\min)$  and  $V_Z(\max)$  are the nominal LM4050 output voltages  $\pm$  the LM4050 output tolerance over temperature,  $I_Z(\max)$  is the maximum allowable current through the LM4050,  $I_Z(\min)$  is the minimum current required by the LM4050 for proper regulation,  $I_A(\max)$  is the maximum DAC081S101 supply current, and  $I_A(\min)$  is the minimum DAC081S101 supply current.

### 2.2.3 LP3985

The LP3985 is a low noise, ultra low dropout voltage regulator with a 3% accuracy over temperature. It is a good choice for applications that do not require a precision reference for the DAC081S101. It comes in 3.0V, 3.3V and 5V versions, among others, and sports a low 30  $\mu$ V noise specification at low frequencies. Since low frequency noise is relatively difficult to filter, this specification could be important for some applications. The LP3985 comes in a space-saving 5-pin SOT23 and 5-bump micro SMD packages.

20155115

**FIGURE 11. Using the LP3985 regulator**

An input capacitance of 1.0 $\mu$ F without any ESR requirement is required at the LP3985 input, while a 1.0 $\mu$ F ceramic capacitor with an ESR requirement of 5m $\Omega$  to 500m $\Omega$  is required at the output. Careful interpretation and understanding of the capacitor specification is required to ensure correct device operation.

### 2.2.4 LP2980

The LP2980 is an ultra low dropout regulator with a 0.5% or 1.0% accuracy over temperature, depending upon grade. It is available in 3.0V, 3.3V and 5V versions, among others.

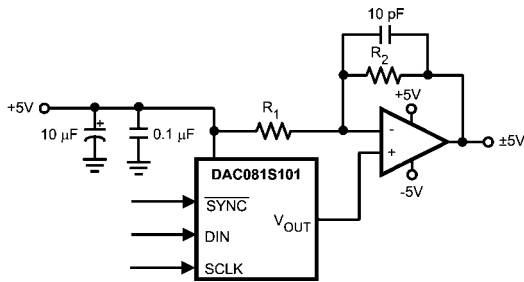

20155116

**FIGURE 12. Using the LP2980 regulator**

Like any low dropout regulator, the LP2980 requires an output capacitor for loop stability. This output capacitor must be at least 1.0 $\mu$ F over temperature, but values of 2.2 $\mu$ F or more will provide even better performance. The ESR of this capacitor should be within the range specified in the LP2980 data sheet. Surface-mount solid tantalum capacitors offer a good combination of small size and ESR. Ceramic capacitors are attractive due to their small size but generally have ESR values that are too low for use with the LP2980. Aluminum electrolytic capacitors are typically not a good choice due to their large size and have ESR values that may be too high at low temperatures.

### 2.3 BIPOLAR OPERATION

The DAC081S101 is designed for single supply operation and thus has a unipolar output. However, a bipolar output may be obtained with the circuit in *Figure 13*. This circuit will provide an output voltage range of  $\pm$ 5 Volts. A rail-to-rail amplifier should be used if the amplifier supplies are limited to  $\pm$ 5V.

20155117

**FIGURE 13. Bipolar Operation**

The output voltage of this circuit for any code is found to be

$$V_O = (V_A \times (D / 256) \times ((R1 + R2) / R1) - V_A \times R2 / R1)$$

where D is the input code in decimal form. With  $V_A = 5V$  and  $R1 = R2$ ,

$$V_O = (10 \times D / 256) - 5V$$

A list of rail-to-rail amplifiers suitable for this application are indicated in *Table 2*.

**TABLE 2. Some Rail-to-Rail Amplifiers**

AMP	PKGS	Typ $V_{OS}$	Typ $I_{SUPPLY}$
LMC7111	DIP-8 SOT23-5	0.9 mV	25 $\mu A$
LM7301	SO-8 SOT23-5	0.03 mV	620 $\mu A$
LM8261	SOT23-5	0.7 mV	1 mA

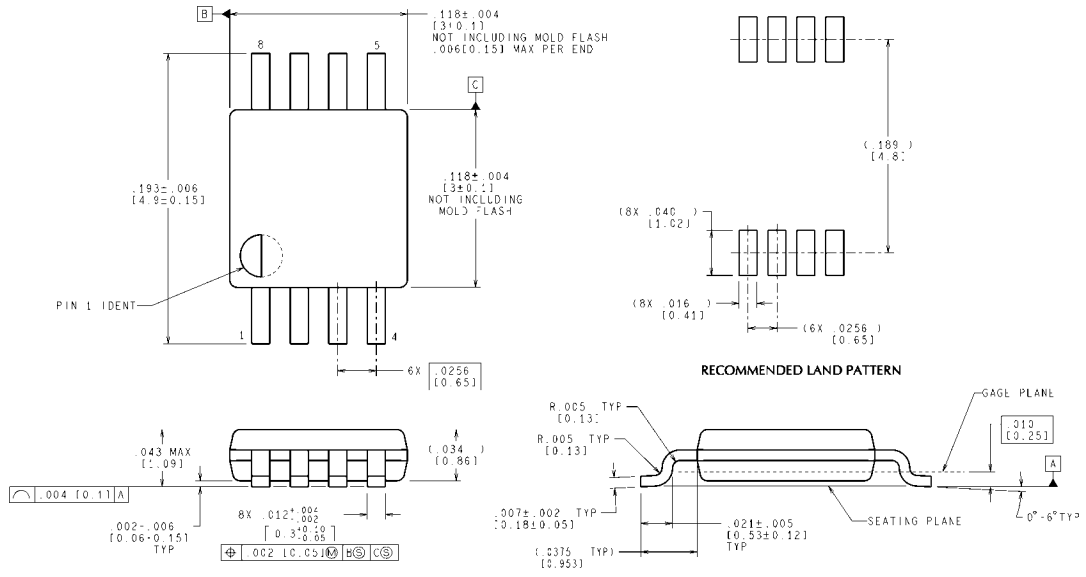

## 2.4 LAYOUT, GROUNDING, AND BYPASSING

For best accuracy and minimum noise, the printed circuit board containing the DAC081S101 should have separate analog and digital areas. The areas are defined by the locations of the analog and digital power planes. Both of these planes should be located in the same board layer. There should be a single ground plane. A single ground plane is preferred if digital return current does not flow through the analog ground area. Frequently a single ground plane design will utilize a "fencing" technique to prevent the mixing of analog and digital ground current. Separate ground planes should only be utilized when the fencing technique is inadequate. The separate ground planes must be connected in one place, preferably near the DAC081S101. Special care is required to guarantee that digital signals with fast edge rates do not pass over split ground planes. They must always have a continuous return path below their traces.

The DAC081S101 power supply should be bypassed with a 10 $\mu F$  and a 0.1 $\mu F$  capacitor as close as possible to the device with the 0.1 $\mu F$  right at the device supply pin. The 10 $\mu F$  capacitor should be a tantalum type and the 0.1 $\mu F$  capacitor should be a low ESL, low ESR type. The power supply for the DAC081S101 should only be used for analog circuits.

Avoid crossover of analog and digital signals and keep the clock and data lines on the component side of the board. The clock and data lines should have controlled impedances.

### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
