DESCRIPTION

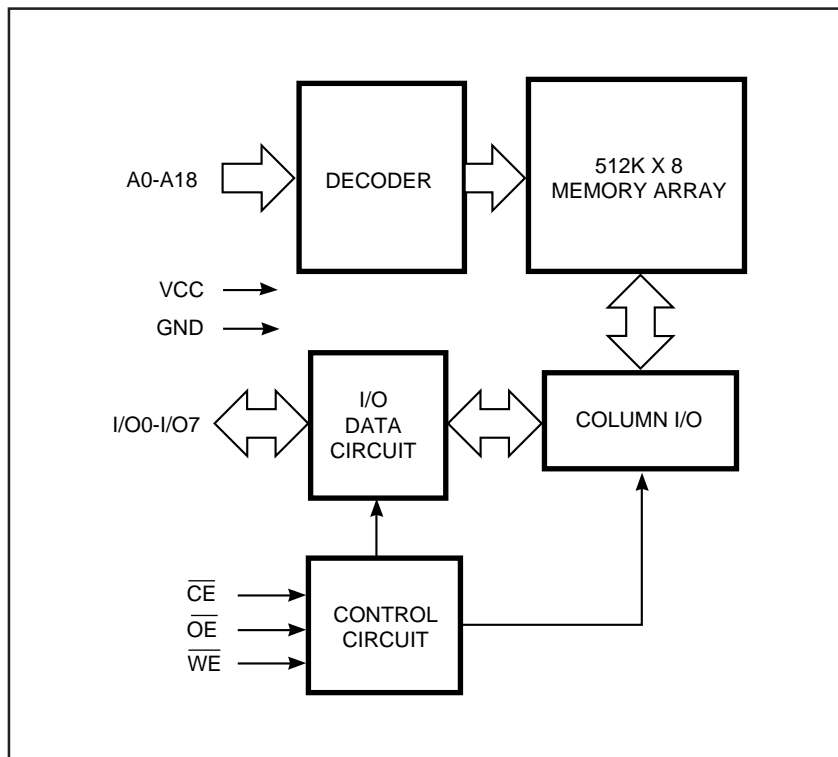

The *ICSI* IC61LV5128 is a very high-speed, low power, 524,288-word by 8-bit CMOS static RAM. The IC61LV5128 is fabricated using *ICSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields higher performance and low power consumption devices.

When \overline{CE} is HIGH (deselected), the device assumes a standby mode at which the power dissipation can be reduced down to 250 μ W (typical) with CMOS input levels.

The IC61LV5128 operates from a single 3.3V power supply and all inputs are TTL-compatible.

The IC61LV5128 is available in 36-pin, 400mil SOJ and 44-pin TSOP-2 package.

2. Tested with the load in Figure 1b. Transition is measured ± 500 mV from steady-state voltage. Not 100% tested.
3. The internal write time is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the write.

AC WAVEFORMS

WRITE CYCLE NO. 1 ^(1,2)(\overline{CE} Controlled, \overline{OE} is HIGH or LOW)

WRITE CYCLE NO. 2 ^(1,2) (\overline{WE} Controlled, \overline{OE} is HIGH During Write Cycle)

WRITE CYCLE NO. 3 (\overline{WE} Controlled, \overline{OE} is LOW During Write Cycle)

Notes:

1. The internal write time is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
2. I/O will assume the High-Z state if $\overline{OE} > V_{IH}$.
